

How java organized

so lets review how java code is organized.

this diagram explain how java code organized.

java code contain classes, methods and packages.

Java objects are created while the code is running, before that its just a variable.

example :

```
public void main(String args[])
{
    human Amir; // its just make a space for human size in the memory
                // its just a variable
    // while excuting the code, it will be created after excuting the following command.
    Amir = new human;
}
```
